

JOINT FILLER FOR GYPSUM BLOCKS: E L A S T O W P 1 2

- ELASTO WP12 is a special top filler for gypsum blocks.
- It is supplied in 30-litre plastic tubs in paste form.
- ELASTO WP12 is white in colour, it should be pressed into the top joint using a plasterer's trowel and smoothly spread on to continue the gypsum wall upwards.
- After a few days, there will be signs of slight settlement, and a surface skin will already have formed.
- Because of the long drying time, it is advisable to block up the walls immediately after installation.
- When the walls are finished, they can be sanded.
- The ELASTO WP12 joint is connected to the ceiling in an elastic and flexible manner. This gives plenty of allowance for movements such as sagging, resulting in fewer cracks.
- ELASTO WP12 is highly fire-resistant, and improves a wall's acoustic properties (See test reports by the Ghent University and the WTCB).
